Consecutive 
Master Study Programme

*Biotechnology and Process Engineering*

at

University of Applied Sciences Flensburg

Flensburg, October 2013
1.1 Objectives of the Master Program Biotechnology and Process Engineering

This is a consecutive Master Program following the Bachelor Program Biotechnologie und Verfahrenstechnik [Biotechnology and Process Engineering] at FH Flensburg. The program is thus mainly targeted at students of our university and grants them the opportunity to gain further qualification at the interface of sciences and technology. As the Program is conducted in English, it is also targeted at foreign students from related subjects of studies.

The Master Program aims to convey the knowledge and know-how necessary to enable students to recognise and analyse problems in the fields of biotechnology and process engineering, to develop own technical and scientific solutions for these problems and to successfully transfer these solutions into market-ready products and services.

This objective is achieved through the teaching of in-depth knowledge on specialized aspects of biotechnology and process engineering on the one hand. On the other hand the curriculum addresses the application of this knowledge to scientific problems from the field. Aside from expertise in the respective field, a number of general skills are further developed with this approach. These qualifications include independent and self-contained working when structuring a problem, identification and application of suitable methods as well as goal oriented, cooperative team work to just name a few.

In the final part of the Program the ability to approach new and unknown topics in a methodical and systematic manner will be further developed by means of continuously working on scientific projects supported and guided by teaching staff.

As stated in the first accreditation already, any graduate of the Master Program Biotechnology und Process Engineering shall be granted admission to Higher Civil Service [Höherer Dienst in German Civil Service].

1.2 Program Outcomes

The qualifications to be acquired as outcomes of the Program may be divided into three main areas:
- Technical and professional skills
- Personal skills
- General skills

In general all students are to be equipped with thorough abilities to analyse and solve technical and scientific problems as they occur in the material converting industry. Aside from a solid basis of knowledge and the ability to draw connections between different fields of expertise this requires the training of goal oriented action and the acquisition of the ability to independently acquire knowledge in the sense of lifelong learning.

According to a recommendation of the Association for Process Engineering and Chemistry Engineering at the Association of German Engineers [VDI-GVC] graduates from
the highly application oriented Master Program *Biotechnology and Process Engineering* may pursue careers doing highly specialized work as well as taking on management and C-level positions in the development, design and realisation as well as management and operation of processes and plants or they may seek an employment within the Higher Civil Service [*Höherer Dienst* in German Civil Service].

Only a combination of the relevant skills and competences named in the following list will lead to success in a professional context; the list furthermore allows for a placement of the different modules and the content of teaching into the context of skills to be acquired in the course of the Program.

- Technical and professional skills
  - Competences in technology and sciences
  - Methodical competence
  - Intercultural competence
- Personal skills
  - Self- and Project Management
  - Communication Skills
  - Responsibility
  - Ability to accept criticism
  - Language Competence (English)
- General skills
  - Problem solving skills
  - Ability for autonomous and lifelong learning
  - Ability to act successfully and focused
    *(Do the right things the right way.)*

The following overview in form of a table visualises the allocation of each type of qualification into the Program’s different modules in the form of a matrix of objectives.
## Classification of the Objectives of the Master Program, 1\textsuperscript{st} semester

Matrix part 2: Modules in the 2\textsuperscript{nd} and 3\textsuperscript{rd} semesters and Master Thesis

### 1.3 Objectives of the Modules

Please also see the module handbook following this!

The respective coordinator will outline the objectives of each module in the module description. Apart from the acquisition of specialised knowledge further aspects on the acquisition of skills will be addressed or result from the form of teaching. Without being categorised according to module, these are:

- Skills to find solutions to problems with the help of state-of-the-art experimental or numeric methods
- Working together with others to achieve a goal (team work, project management)
- Processing and presentation of results (written and oral communication)

Chapter 1.2 matches the objectives and results of the modules as described in the module handbook with the Program’s objectives.
Module Advanced Theory of Cell Biology and Cell Culture Technology:
The module is divided into two parts and teaches the students the necessary background knowledge to enable them to work with cell cultures. The first part will deal with current research results from molecular biology and current methods from cell biology. The processes and methods will be revised, extended and transferred to the requirements of cell culture technology.
In the second part students will acquire in-depth knowledge on bio process engineering necessary for the application in animal cell cultures. Thus students will be enabled to design and measure fermentation with cell cultures. Students will be able to analyse, evaluate and communicate operating data and results from cell culture processes.

Module Advanced Instrumental Analysis:
This module aims at familiarising the students with the basic principles, the terminology, methodology, instrumentation, implementation and characteristics of the most commonly used spectroscopic measuring techniques and chromatographic separation methods. Students will acquire the ability to appropriately apply these methods to identify physical and chemical data which need to be determined as part of biotechnological and process engineering control and research processes.
In the end students will have gained the competence to design and manage analytical procedures as well as to evaluate the data thus generated for the purpose of process control and management.

Module Advanced Theory of Process Engineering:
This module builds on classes on Thermodynamics and Heat and Mass Transfer from the Bachelor Program. In regards to Thermodynamics knowledge on the behaviour of real fluids and real mixtures in particular will be taught, in regards to Mass Transfer the module will address the specific characteristics of Mass Transfer in analogy to Heat and Impulse Transfer as well as their differences. Typical processes in which mass transfer plays a key role will be addressed. The difference between the balance based processes the Bachelor Program focused on in large parts and transfer based processes will be paid special attention to.
Accompanying tutorials will further enhance the knowledge thus acquired: Thermodynamic state variables will be determined and reported for basic operations in process engineering, in the field of mass transfer the students will learn to set up transfer models and to generate results for the transfer variables.
Students will be able to integrate thermodynamic and mass transfer specific models into the design of typical basic operations. They will be able to evaluate results from research and actual plant operation.

Module Bioanalysis:
Students are introduced to suitable measuring sensors for a number of biological and physic-chemic parameters and their function.
On the basis of this knowledge measuring sensors are chosen and applied to identify biological and physic-chemic parameters, e.g. microorganisms, for various tasks that are to be executed in a laboratory.
Students will be able to tackle bio analytical tasks on a microscopic as well as on a macroscopic level.

Module Design, Economy and Sustainability in Chemical Engineering:
Students will acquire basic knowledge and methods to be able to design biotechnological and procedural processes in regards to plant design and construction. Special focus
will be paid to a holistic approach to consider economic, ecologic and social aspects in the same manner and thereby follow the principles of sustainability.

**Module Fluid Flow in Process Equipment:**
The flow of fluids in multi-phase mixtures is the rule rather than the exception in process equipment. The basics of this flow will be taught. Tutorials will focus on the design of equipment and components to generate dispersed phases, guide them through the apparatus in the desired manner and separate them again later on. Students will be able to hydraulically design suitable apparatuses and plants for multi-phase reaction and separation processes in a basic draft.

**Module Quality Systems in Food Industry:**
Students will acquire the characteristics of a quality management system. Finding solutions to quality problems will be part of the module as well as the specific requirements of the food industry. Examples from the food industry will be used to analyse quality problems and arrive at solutions for them. Students will be able to apply the principles of quality management.

**Module Professional Leadership and Rhetoric:**
Students will acquire basic knowledge on Human Resources Management, Rhetoric and verbal and non-verbal communication. Tutorials and trainings will enable the students to acquire a number of basic techniques such as “active listening” and “coaching” in Human Resources Management as well as argumentative and persuasion techniques to be used when dealing with staff and colleagues. Students will thus improve their language and communication skills which are necessary for Human Resources Management.

**Module Identification and Evaluation of Relevant Literature for Scientific Projects:**
Students will be introduced to the methods of scientific bibliographic research with the help of examples. They will develop the ability to identify and evaluate the scientific status quo of a project according to literature and use literature to solve problems. They will be able to manage a project more efficiently based on their knowledge of the scientific background.

**Module Particles and Cells Measuring Techniques:**
Taking into account the most recent scientific literature the students will acquire knowledge on measurement in the field of particle technology and purification technology. Some of the measurement methods will be applied as part of hands-on lab classes. The students will evaluate the results of the work carried out here in regards to their significance for practical application. Students will be able to choose the appropriate method of measurement, evaluate the results gained through it and draw conclusions regarding a product's properties and characteristics.

**Module Disintegration of Particles and Cells:**
Taking into account the most recent scientific literature students will acquire knowledge on disintegration and disruption techniques in the field of particle technology and purification technology. The use of appropriate measuring methods for process management will be discussed; the design of disintegration processes from development to testing level as well as the process design will be addressed. A process in a laboratory mill will be used to study and experience the topic in greater detail.
Students will be able to design appropriate disintegration processes, evaluate their performance and thus generate the desired product properties and characteristics.

**Module First-Time Manager:**
Current management principles will be employed to familiarise students with the characteristics of and requirements for managing positions. Examples will help to teach students management and leadership, teamwork and means for efficient communication. Students will thus be enabled to apply management and communication skills.

**Module Project Theory und Team Project:**
These 24 CP elective modules provide a thematic unit made up of theory and practice (project). Each lecturer may decide on the manner of teaching the theory part of the module, this may be done in the form of seminar classes or lectures. In either form students will acquire the theoretical background required to successfully execute the complex project work in a group. Not only will the participation in this module help to develop technical skills, it will also and especially train personal and general skills as mentioned and discussed in chapter 1.2 of this report.
Students will be able to define goals for a complex problem, take measures, i.e. use their theoretical and practical knowledge to decide on what steps to take to achieve these goal or sub-goals, to visualise and evaluate generated results as well as to communicate the results orally or in a written text.

### Study Goals:

**Knowledge:**
- Thermodynamic behaviour of real fluids and mixtures
- Extended knowledge on diffusion and convection mass transfer
- Analogy between heat and mass transfer

**Skills:**
- Extend fundamental principles of thermodynamics to process fluids
- Calculate state and operational variables in typical processes
- Evaluate process operation according to the type and intensity of mass transfer
- Estimate material property data for process operation
- Set-up mass transfer models
- Solve mass transfer models (numerically with the help of software)

**Expertise:**
- Integrate thermodynamic and mass transfer calculations into a design process for various process operations
- Validate results from calculation with operational data

### Content:

1. Thermodynamic Equilibrium
   - of pure components
   - of mixtures (VLE, VLLE)
2. Calculational methods to predict thermodynamic equilibrium
3. Mass Transfer
   - diffusion, diffusion coefficients
   - mass transfer models
   - mass transfer coefficients
   - mass transfer applications

### Assessment:

Written or oral exam

### Media:

Lecture Notes, Slides, Board, E-Learning

### Literature:

- Sandler: Chemical and Engineering Thermodynamics, JOHN WILEY & SONS
- Bird, Stewart, Lightfoot: Transport Phenomena, JOHN WILEY & SONS

### Degree Programme:
M. Sc. Biotechnology and Process Engineering

### Title of Module:
Project Theory: Chemical Process Engineering / Green Engineering

### Abbreviation:
CPET

### Title of Class:
**Computer Aided Process Engineering (CAPE)**

### Semester:
2

### Responsible for Module:
Prof. Dr.-Ing. Claus Werninger

### Lecturer:
Prof. Dr.-Ing. Claus Werninger

### Language:
English

### Assignment to Programme:
M. Sc. Biotechnology and Process Engineering
Optional Compulsory Class, Semester 2

### Class Type / Hours:
Lecture and Computer Laboratory / 2 & 2 h per week

### Workload:
- Study time in class: 60 h
- Study time at home: 120 h

### Credits:
6

### Requirements:
- Participation in Lecture
- Advanced Theory of Process Engineering

### Study Goals:

**Knowledge:**
- Learn about heuristic and rigorous design rules to design single equipment and processes
- Obtain basic knowledge on the importance of thermodynamic modelling for material property and thermodynamic state modelling

**Skills:**
- Learn to select appropriate path of reaction and separation for a process
- Apply state-of-the-art software for computer aided process engineering (CAPE)

**Expertise:**
- Integrate CAPE calculations into a design process
- Validate results from calculation with operational data
- Use CAPE in redesign existing processes

### Content:
- Fundamentals of Process Design – Structure and Synthesis
- Chemical Reaction Schemes, Equilibrium and Reactor Design
- Design of Separation Sequence and Technology
- Process Analysis

### Assessment:
Written or oral exam

### Media:
Lecture Notes, Slides, Board, E-Learning, CAPE software

### Literature:
- Seider, Seader, Lewin: *Process Design Principles*, JOHN WILEY & SONS
- Turton, Baille, Whiting, Shaewitz: *Analysis, Synthesis, and Design of Chemical Processes* PRENTICE HALL
- Biegler, Grossmann, Westerberg: *Systematic Methods of Chemical Process Design* PRENTICE HALL
- Douglas: *Conceptual Design of Chemical Processes*, McGRAW-HILL
- Schuler: *Prozesssimulation*, WILEY – VCH

**Study Goals:**

**Knowledge:**
- Acquire specific knowledge according to the project topic

**Skills:**
- Apply scientific methods based on sustainability issues to match the principles of Green Engineering
- Increase proficiency with CAPE software
- Set-up operational plans for group members
- Arrange group work into working packages
- Communicate on milestones with group members and supervisor

**Expertise:**
- Project Management Principles
- Estimate the benefits of CAPE for research and design

**Content:**
A group of 2 – 4 students will work out a process design of a new process or an alternative to an existing process comprising basic layout of equipment and simulation of the process. An important aspect of the project work is the research on operational, kinetic and material data from literature or from experiment. Costs of process erection and operation are to be estimated by simple means. Appropriate hours in class will be spent to discuss problems in team with or without the professor. Results are to be presented orally by contributions from each team member and as a written report of the team.

**Assessment:**
Written report and oral presentation

**Media:**
Board, Overhead, presentation, CAPE software, E-Learning

**Literature:**
- Allen, Shonnard: Green Engineering PRENTICE HALL
- Seider, Seader, Lewin: Process Design Principles JOHN WILEY & SONS

### Degree Programme:
M.Sc. Biotechnology and Process Engineering

### Title of Module:
Project Theory:
Food Biotechnology and Processing 1

### Abbreviation:
FBP I

### Title of Class:
**Food Biotechnology and Processing 1**

### Semester:
2

### Responsible for Module:
Prof. Dr. Birte Nicolai

### Lecturer:
Prof. Dr. Birte Nicolai

### Language:
English

### Assignment to Programme:
M. Sc. Biotechnology and Process Engineering
Optional Compulsory Class, Semester 2

### Class Type / Hours:
Seminar / 4 h per week

### Workload:
- Study time in class: 60 h
- Study time at home: 120 h

### Credits:
6 in combination is FBP II

### Requirements:
Knowledge of fundamental aspects of fermentation, processing and analytical methods

### Study Goals

**Knowledge:**
- Learn about food biotechnological production methods
- Understand processes during food fermentation
- Learn about process parameters and analytical methods

**Skills:**
- Increase proficiency about food fermentations
- Set-up process conditions for food production
- Assess foods according to their analytical parameters

**Expertise:**
- Independent study of content
- Self-organization

### Content:
During this seminar students learn the theoretical background of food biotechnology and processing. This is either done by presentation and by self-studies of the given literature.

### Assessment:
Written or oral exam

### Media:
Slides, blackboard, literature

### Literature:
- Primary literature as announced in class

Title of Module: Team Project: Food Biotechnology and Processing

Abbreviation: FBP P

Title of Class: Food Biotechnology and Processing (Team Project)

Semester: 2

Responsible for Module: Prof. Dr. Birte Nicolai

Lecturer: Prof. Dr. Birte Nicolai

Language: English

Assignment to Programme: M. Sc. Biotechnology and Process Engineering
Optional Compulsory Class, Semester 2

Class Type / Hours: Project / 8 h per week

Workload:
- Study time in class: 120 h
- Study time at home: 240 h

Credits: 12

Requirements: Knowledge of fundamental aspects of fermentation, processing and analytical methods

Study Goals

Knowledge:
- Acquire specific knowledge according to the project topic

Skills:
- Increase proficiency with analytical methods and production equipment
- Set-up plans for the experimental test design
- Arrange group work

Expertise:
- Project Management principles
- Analytical thinking

Content:
Students will be introduced to industrial food production by visiting food producing plants and doing food productions in a pilot plant. They will familiarize with the relevant process parameters and analytical methods. Based on the learning, they will work on a current scientific problem in food biotechnology.

Assessment: Project report

Media: Slides, blackboard, pilot plant equipment

Literature: Primary literature as announced in class

**Study Goals:**

**Knowledge:**
- Acquire basic knowledge of HRM in academic views
- Acquire basic knowledge of rhetorics
- Acquire basic knowledge of verbal and non-verbal communication

**Skills:**
- Achieve and increase competence in speech
- Use “Active Listening” in personal management
- Perform “Coaching” as an active element of leadership
- Convincing interaction with employees and peers

**Expertise:**
- Competence in rhetoric – basics, metaphors and style
- Competence in human resources management
- Competence in structured communication

**Content:**
Personnel Management in academic views
Motivation and responsibility in HRM
Rhetorical craftsmanship – basics, metaphors, analogies, style
Active listening in practical management
Structured communication as a tool for effective interaction
Corporate communication culture
Formal authority and informal power
Praise and criticism in critical evaluation
Personnel recruiting and -development - and costs
Team development and coaching

**Assessment:**
Written exam or homework assignment or presentation

**Media:**
Board and presentation

Degree Programme: M.Sc. Biotechnology and Process Engineering  
Title of Module: Elective Courses – Particles and Cells Measuring Techniques  
Abbreviation: EC-PartM  
Title of Class: Particles and Cells Measuring Techniques  
Subtitle: Measuring Particle Size Distributions and Evaluation  
Semester: 1  
Responsible for Module: Prof. Dr.-Ing. Wolfgang F. Hess  
Lecturer: Prof. Dr.-Ing. Wolfgang F. Hess  
Language: English  
Assignment to Programme: M.Sc. Biotechnology and Process Engineering  
Elective Class, Semester 1  
Class Type / Hours: Lecture, Workshop and Laboratory / 4 h per week  
(maximum class size: 15 students)  
Workload:  
Study time in class: 60 h  
Study time at home: 120 h  
Credits: 6  
Requirements: Knowledge of fundamental aspects of Particle Technology and Down Stream Processing  
Study Goals / Skills: On the basis of the latest scientific literature the students will obtain knowledge of measuring techniques within the field of Particle Technology and Down Stream Processing. Theory will be accomplished by practical experience in the lab. Students will be able to evaluate the results according to their real sense and practical use. The students will reach the competence to measure, evaluate and explain product properties regarding to Particle Technology, e.g. the particle size distribution, and to Down Stream Processing, e.g. disintegration of cells.  
Content:  
2. Basics of the physical measuring techniques measuring particles and cells in dispersions down to nano scale  
3. Separation techniques in biotechnology and process engineering  
4. Incremental and cumulative processes  
5. State-of-the-art optical analyser techniques: Dispersion of laser light, dynamical dispersion  
6. Comparability and reliability of the results to be used in process control and quality management  
Assessment: Homework assignment or project report and oral presentation  
Media: Scientific papers, computer, overhead projector, beamer  
Literature:  
- A. Zhong, Lin Wang: Characterization of Nanophase Materials  
  WILEY-VCH, Weinheim  
- Brian H. Kaye: Characterization of Powders and Aerosols  
  WILEY-VCH, Weinheim
